TITLE: Certain aspects of obesity pathogenesis and therapy

SOURCE: Voprosy pitanija, v. 24, no. 5, 1965, 36-42

TOPIC TAGS: nutrition, pathogenesis, physiotherapy, chemotherapy

ABSTRACT: The effects of physical exercise, steroids and thyroid preparations on weight reducing therapy were investigated in experiments on women ages 19 to 38 yrs. clinically diagnosed as obese (81 to 105 kg) with no complicating factors. Following a preliminary period during which subjects were on a 2,300 calorie diet, they were divided into two groups and both were placed on a 1,200 calorie diet (140 g of carbohydrate, 73 g of protein, and 40 g of fat). The first group followed the regular hospital schedule with daily 4 hr walks and 8 hrs of sleep. The second group exercised (physical exercises, swimming, and sports) 4 hrs daily. At the end of two weeks weight losses for both groups were approximately the same (.15 kg a day); but, with a hydrostatic method of

ACC NR: AP6000839

weighing, it was found that the exercising group lost mostly fatty tissue and the nonexercising group lost mostly non-fatty tissue. In other experiments the authors found that physical exercise combined with appetite depressants, and in some cases with steroids, helps maintain a favorable nitrogen balance and weight losses are primarily at the expense of fatty tissue. Use of thyroid preparations in the absence of hypothyroidism produces rapid weight losses, approximately twice as high as in controls, and is shortly followed by symptoms of medication induced hyperthyroidism. More recent experimental and clinical data on obesity pathogenesis indicate that the role of certain other factors should be more carefully studied: regularity of meals, prolonged exposure to substances affecting lipometabolism (e.g. DDT), stress stimuli, and absolute or relative deficiencies of certain nutritional substances. AUTHORS: Durović, Slavomil and Matherny, Mikuláš
TITLE: Distribution of trace impurities during crystal-
lization of melts
SOURCE: III. Konference o monokrystalech. Prague,
Vyzkumný ústav pro minerály, 1960. 81 - 87

TEXT: The authors checked the validity of the lognormal distribution of elements expounded by L.H. Ahrens (Geoch. et Cosmoch. Acta, 5, 49; 6, 121, 1954 and 11, 205, 1957), using about 200 polarographic determinations of nickel, copper, zinc and manganese in pyrrhotine of Helpa (Slovakia). This was done since this pyrrhotine originated from the recrystallization of the original material during regional metamorphism. The distribution of trace impurities was found to be lognormal. To determine whether this distribution could be due to recrystallization, a number of crystallization experiments were carried out with inorganic salts. In some cases, the trace out with cation of the basic salt. The results proved to be in accordance Card 1/2

Abstract : The utilization of plants, which have a root system
endowed with various mechanical properties, is recommended
in solving the problem of combating erosion on the slopes
of Hrubyy Jesenik in the northern Moravia.
The author distinguished the following 4 groups of plants.
I. Fastening species: Calluna vulgaris, Sarothamus
scoparius, Betula veriucosa.
2. Pioneer plants, settling the most unfavorable places
of crumbling. They are distinguished by a great sturdiness

1954. New method of determination of free sulphide [P. D. Nikorimaki and S. N. Seauou].
Kaus. u. Gumm., 1957, 10, WF 146-2. Comminuted vulcanised or unvulcanised rubber wires are boiled with sodium sulphide solution and the resulting polysulphide oxidised with hydrogen peroxide to give sodium sulphate and sulphuric acid; the acid formed neutralises an equivalent amount of caustic soda solution added to the sulphide solution as the latter is excess. The determination is then carried out by back-titration with 0.1 N sulphuric acid and methyl orange as an indicator. In the presence of alkaline reactive constituents in the mix, the test sample is first neutralised with dilute hydrochloric acid and then treated as above. The method is rapid, inexpensive, and suitable for works control. There are 8 references. 44482

TITLE: Bismuth oxide-titanium dioxide system

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy. v. 1, no. 2, 1965,
232-235

TOPIC TAGS: bismuth oxide, titanium dioxide, phase diagram, phase equilibrium

ABSTRACT: The bismuth oxide-titanium dioxide system was studied using thermal analysis and x-ray diffraction. The work was done in platinum or platinum-rhodium crucibles. The phase diagram is shown in fig. 1 of the Enclosure. Three compounds are formed in this system: $4\text{Bi}_2\text{O}_3 \cdot \text{TiO}_2(\text{Bi}_8\text{Ti}_{14})$, $2\text{Bi}_2\text{O}_3 \cdot 3\text{TiO}_2(\text{Bi}_4\text{Ti}_3\text{O}_{12})$ and $\text{Bi}_2\text{O}_3 \cdot 4\text{TiO}_2(\text{Bi}_2\text{Ti}_4\text{O}_{11})$. All of these compounds melt in an incongruent manner: $\text{Bi}_8\text{Ti}_{14}$ at 865°C , $\text{Bi}_4\text{Ti}_3\text{O}_{12}$ at 1210°C and $\text{Bi}_2\text{Ti}_4\text{O}_{11}$ at 1275°C . At 670°C $\text{Bi}_4\text{Ti}_3\text{O}_{12}$ undergoes a reversible phase transition. According to thermal analysis data the other two compounds undergo no conversions in the investigated temperature region.

Card 1/3

L 49784-65

ACCESSION NR: AP5009374

$\text{Bi}_8\text{TiO}_{14}$ is produced as a result of an exothermic reaction at 830°C . At 835°C a $\text{Bi}_8\text{TiO}_{14}$ and Bi_2O_3 eutectic mixture is crystallized, it contains 97% Bi_2O_3 and 3% TiO_2 . Orig. art. has: 1 table and 3 figures.

TITLE: Investigation of the Reaction of Phenol Alkylation by Amylenes in the
Presence of Cationites and the Dealkylation of Tertiary Amylphenol as
a Method of Separating Tertiary Amylenes From Pentane-Amylene Fractions

PERIODICAL: Zhurnal prikladnoy khimii, 1960, Vol 33, Nr 4, pp 953 - 956

TEXT: Tertiary amylphenol is one of the most important semi-finished products obtained on the base of petroleum raw material. It is an initial product for the manufacture of oil-soluble phenol-formaldehyde resins, oxethylated compounds which are surface-active substances, etc. As catalyst two Soviet cationites were used: KU-1 which is a sulfonated condensation product of phenol with formaldehyde, and KU-2 which is sulfonated copolymerization product of styrene with divinylbenzene. The study of the reaction of alkylation of phenol with amylenes in the presence of these cationites showed that the reaction proceeds selectively with the KU-2 cationite at a temperature of 135°C, producing para-tertiary-amylphenol with a yield of 90 - 96% in the case of complete absence of polyalkylated phenols. The new method of producing tertiary amylphenol is distinguished by a simple technology and avoids the process of washing

the alkylate with water and the formation of harmful phenol waste waters. As a result of studying the reaction of dealkylation of tertiary amylnphenol in the presence of chlorobenzenesulfoacid, the transformation of amylnphenols in sufficient quantities with the formation of pur- tertiary amylene proved to be possible. The new method of the synthesis of amylnphenol with subsequent dealkylation can be used as a variant of separating amylenes from the pentane-amylene fraction for the subsequent conversion of amylenes into isoprene.

There are: 3 tables and 1 Soviet reference.
